

Opportunities and Challenges in Multi-Model, Multi-Dimensional Image Analysis for Drug Discovery

Dr Yin Hai Wang (Senior Scientist, Image Analytics)
Quantitative Biology Department, Discovery Sciences

9th March 2016

the Quantitative Biology Department (QuBi)

Mass Spectrometry Imaging (MSI)

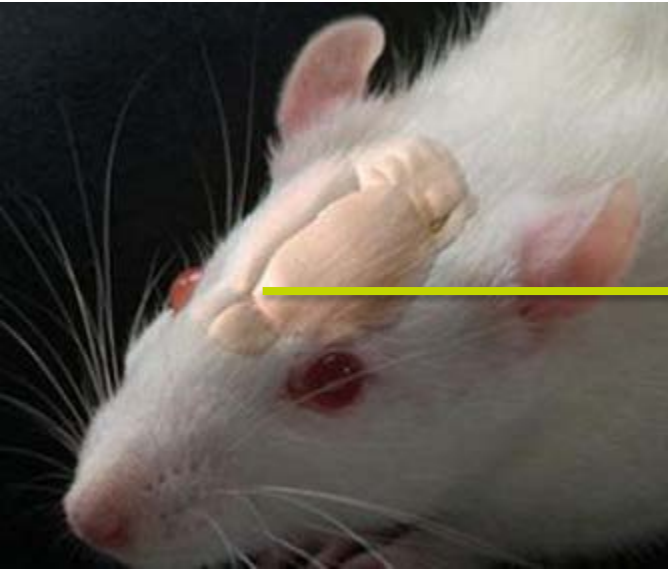

Mass Spectrometry Imaging

What is Mass Spectrometry Imaging?

A single pixel in an MSI image is corresponding to a vector of numerical values.

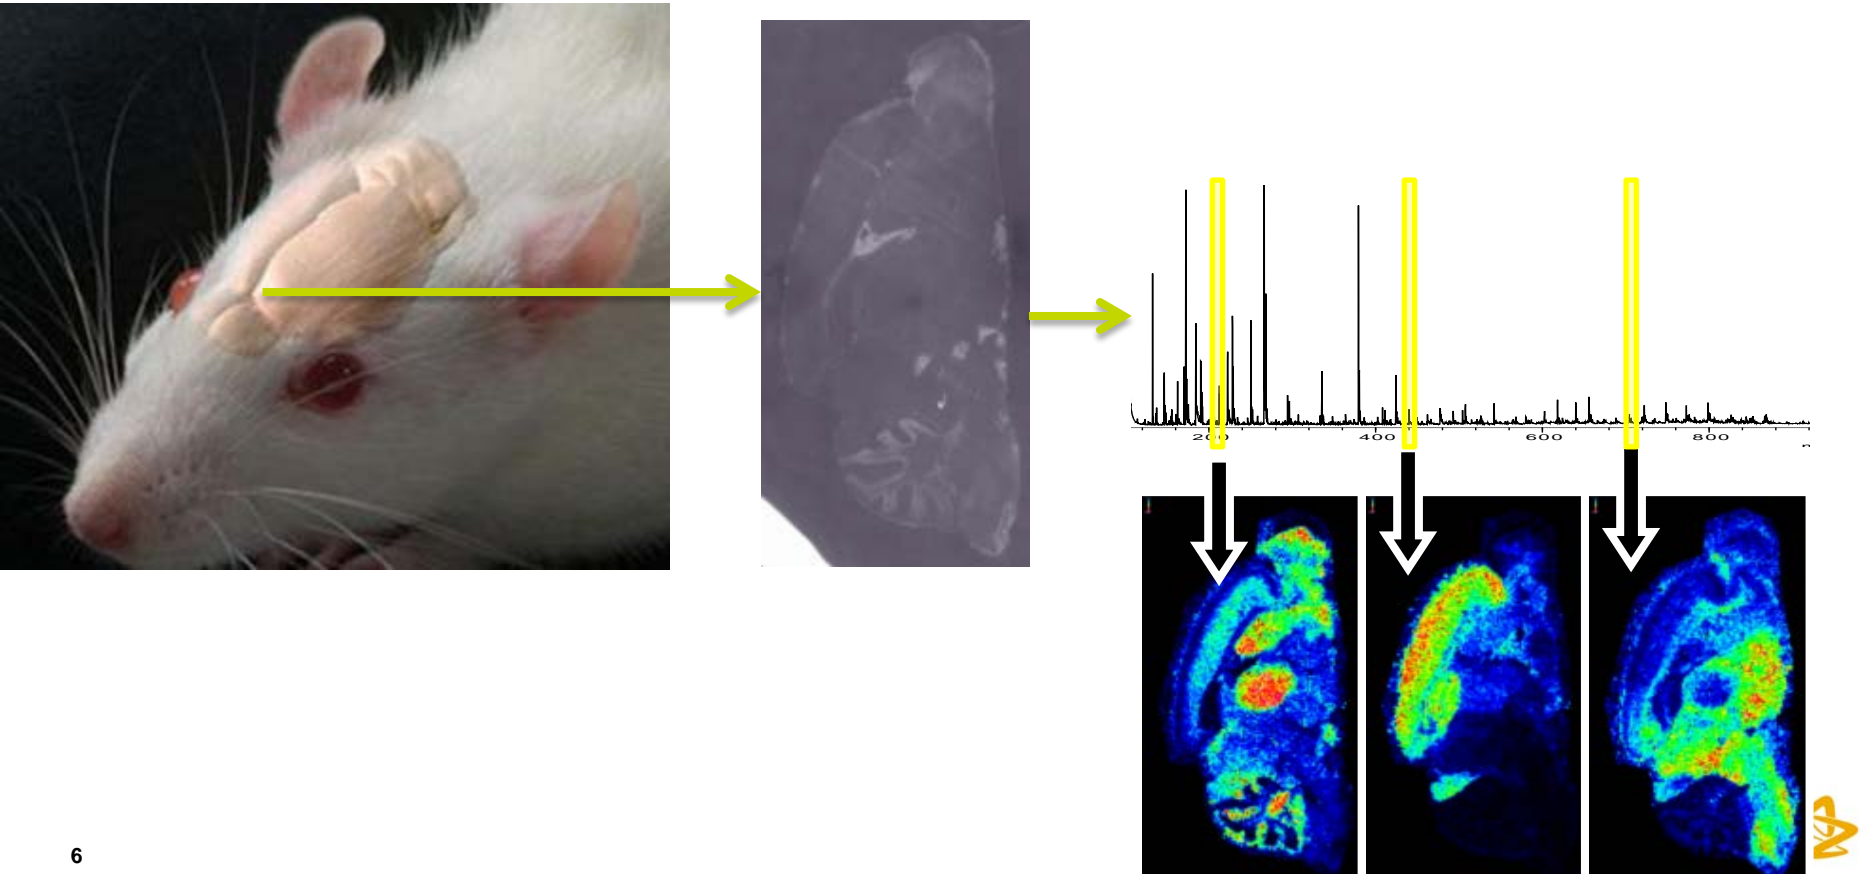

Fresh frozen sample

an MSI image

What is Mass Spectrometry Imaging?

Why Mass Spectrometry Imaging?

1. MSI is able to detect and visualise the chemical composition.
2. MSI has ability to describe metabolite, drug concentration and biomarkers simultaneously.
3. MSI is applicable to investigate drug's efficacy and safety.
4. MSI is label-free.

MSI – Relationship Among Metabolite, Drug & Biomarker

MSI + H&E

MSI images

Haematoxylin & Eosin
(H&E)

To look at the
morphology, tissue
structure

H&E

H&E

H&E + MSI (Metabolite)

- The spatial distribution of metabolite
- The correlation between tissue morphology with metabolite molecules

H&E + MSI (Drug)

- The spatial distribution of drug X
- The relative concentration of drug X at different tissue locations
- The relationship between drug X and tissue morphology

Drug X

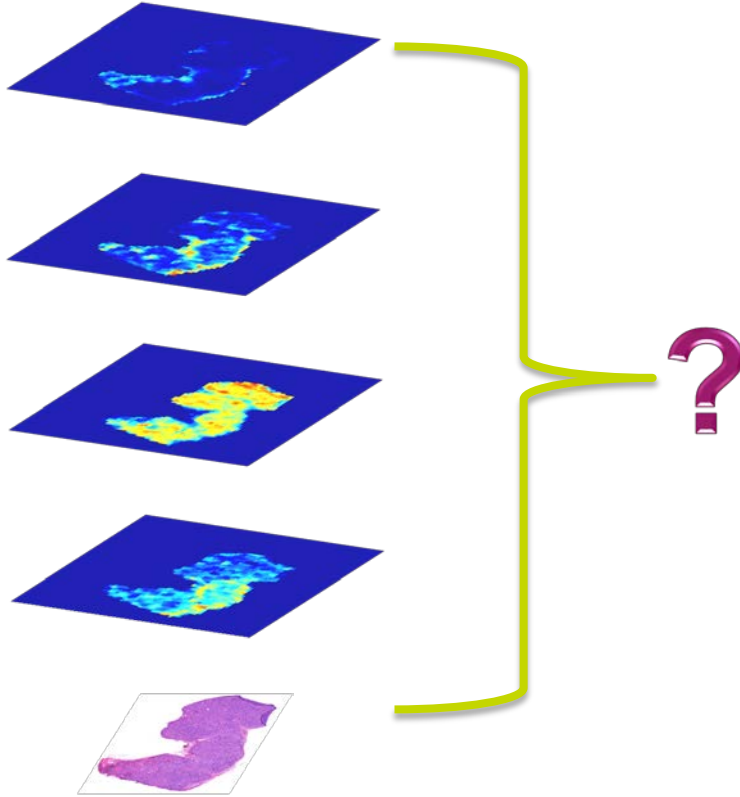

H&E + MSI (Biomarker)

- The location and spatial distribution of biomarker A
- The relative level of expression of biomarker A
- The relationship between biomarker A and tissue morphology

Biomarker A

H&E + MSI (Metabolite, Drug, Biomarker)

Foreseeable problems:

1. Image Registration between MSI and H&E
2. Visualisation
3. Tissue image processing (e.g. machine learning for the recognition of tumour *)
4. Multi-dimensional data analysis:
 - Multiple MSI images
 - MSI intensity + spatial locations
 - H&E tissue structure
 - Regional relationships
 - Relationship among metabolite, drugs and biomarkers)
 - Machine learning for rapid matching

*Y. Wang, et al. "Assisted diagnosis of cervical intraepithelial neoplasia (CIN)." *IEEE Journal of Selected Topics in Signal Processing*, 3.1 (2009): 112-121.

Immunohistochemistry (IHC)

Fluorescent Multiplexing

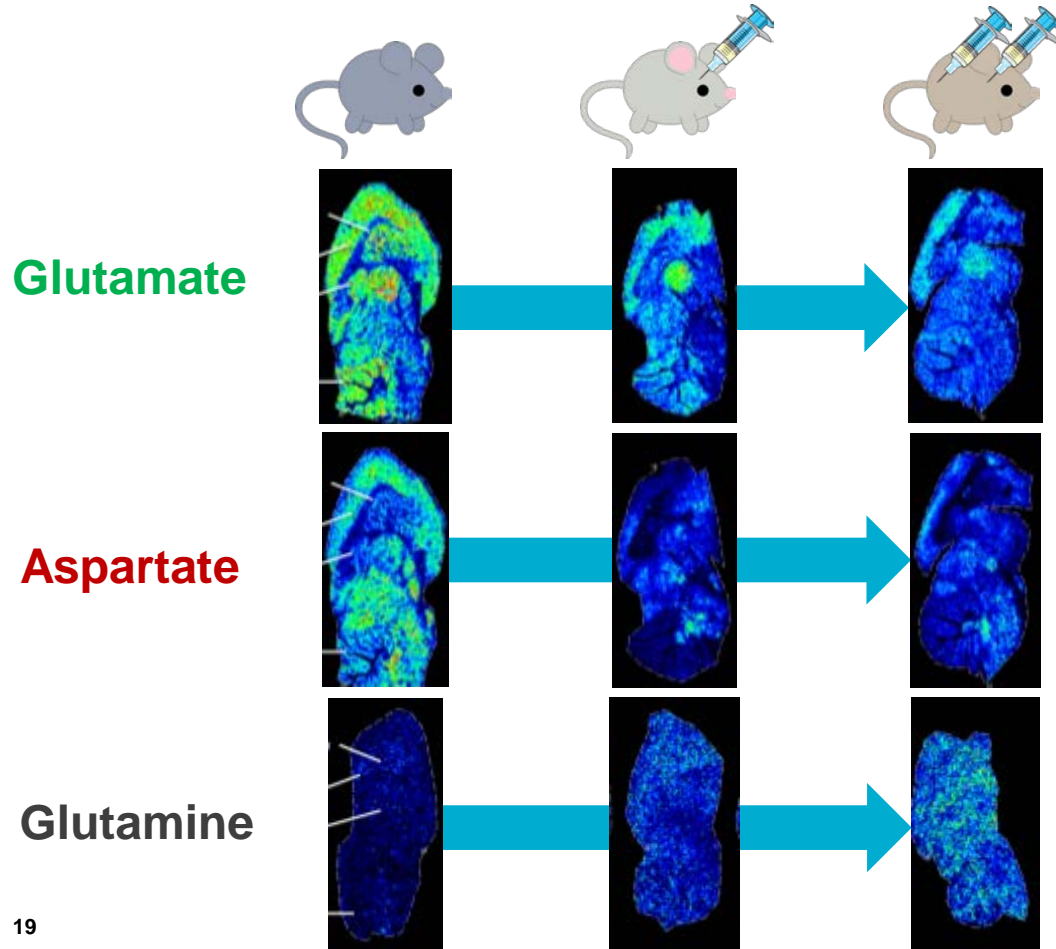

MSI + H&E + Immunohistochemistry (IHC) + Fluorescent

Multiple image modalities: m IHC + n H&E + p MSI + k Fluorescent

MSI for Dose Responses

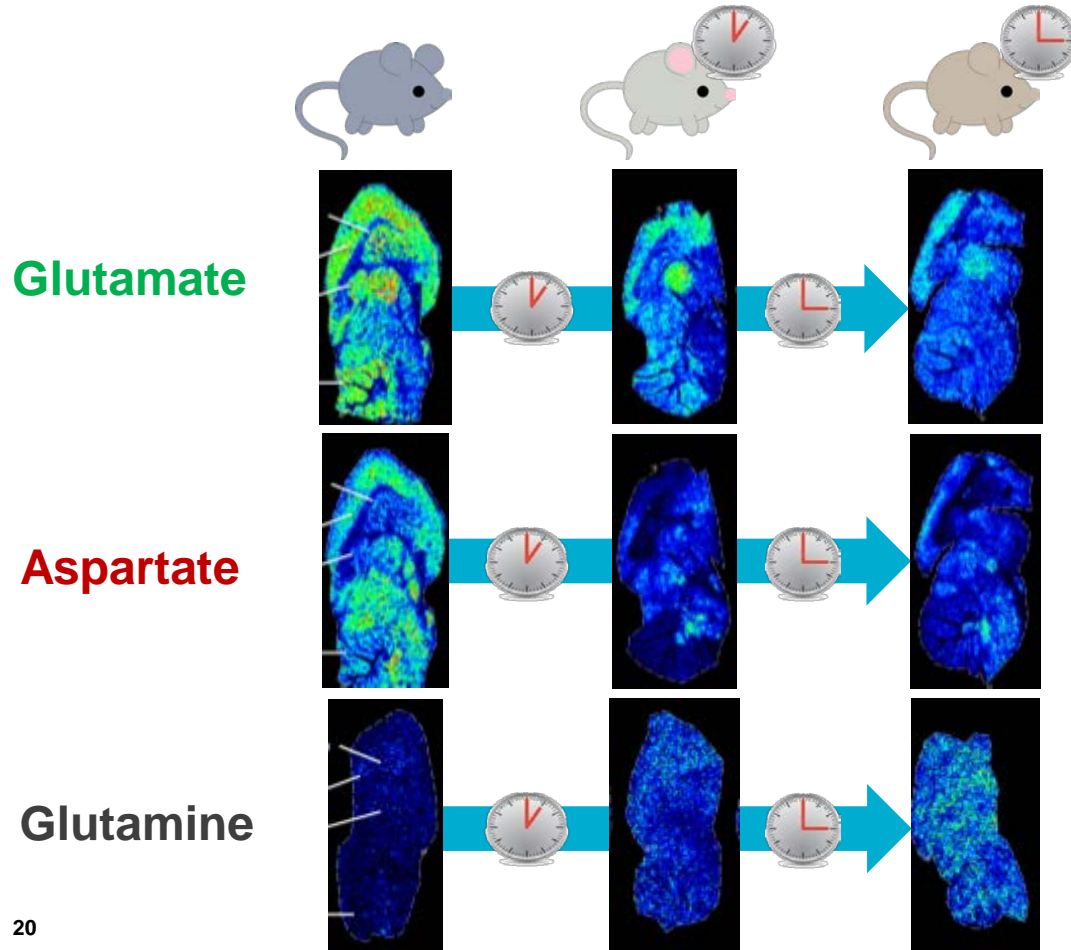

Foreseeable problems:

1. Extra dimension of data
2. MSI Image registration (not from a same host)
3. The comparison of dose responses

MSI for Kinetics

Foreseeable problems:

1. Extra dimension of data
2. MSI Image registration (not from a same host)
3. The comparison of drug responses over a period of time

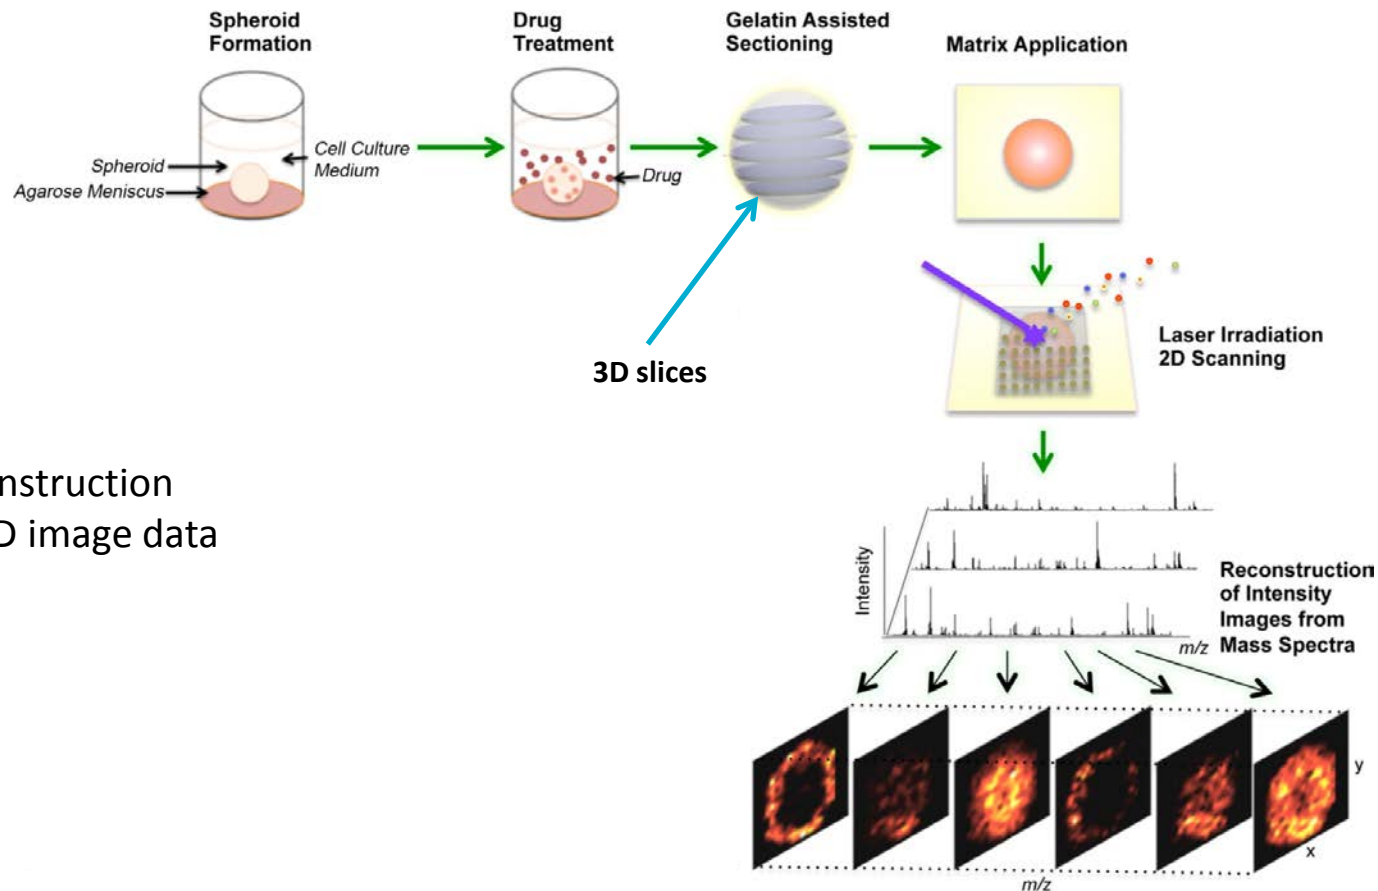

The 3D Spheroid Model

85% of early clinical trials for novel drugs fail.

MSI for 3D Spheroid Models

Foreseeable problem:

3-dimensional image reconstruction
Comparison of complex 3D image data

MSI Image Analysis

Multiple image modalities:

m IHC + n H&E + p MSI + k Fluorescent

Multiple image dimensions:

2D + colour channels + dose responses + kinetics + 3D

£1 million + 1TB + 6 months later

Difficult

Formalin fixed paraffin embedded

Cross-linking Diffusion Suppression

Free drug from total

Does break interactions

Sub-cellular

Instrument limitations

Covalently bound

Doesn't break bonds

Terminal sampling required

No monitoring

Archived samples

Incorrect collection and storage

Antibodies or ADC

Low copy number/detection

Proteomics

Mass range limited (<20kDa)

Clinical samples

Sample collection

Readily performed

Drug and metabolite

Differentiate by *m/z*

On-tissue quantitation

Multiple approaches

Pathology support

Label-free and multiplexed

Investigatory

Comparing tissue for unknowns

Target engagement

Biomarker analysis

Efficacy

Studying unanticipated outcomes

Blood poor surrogate

Blood brain barrier / tumours

What Machine Learning Could Do to Help?

- MSI images are a stack of images.
 - The matching between tissue morphology/structure (from H&E) and MSIs
 - The matching between IHC expression and MSIs
 - The matching between Fluorescent signals and MSIs
- We expect machine learning to play a key role in MSI image analysis, and be aware of the following factors:
 - Expert input
 - Uncertainty
 - Unknown

Summary

1. At AstraZeneca, we are investigating novel imaging modalities.
2. We are generating a large amount of multi-modal image data, and in turn leads to a large amount of multi-dimensional numerical data.
3. We are pursuing better image and data analytical methods, machine learning approaches to
 - Unleash the power of multiple image modalities (IHC + H&E + MSI + Fluorescent)
 - Unleash the power of multiple dimensional data (2D + colour channels + dose responses + kinetics + 3D)
 - To better understand biology and drugs' mechanism of actions.
