Canonical Correlation Analysis (CCA) is much like Principal Component Analysis (PCA).

Similarly, the term may refer to:

- A mathematical object
- A class of algorithms
- Process for dimension reduction or interpretation

Structure of talk

- Population CCA
- CCA as a tool for data analysis
- Our specific motivations and contributions

Image: A matrix

In words: Given random variables $X \in \mathbb{R}^p$, $Y \in \mathbb{R}^q$ find linear combinations $u^T X, v^T Y$ with maximal correlation, successively, subject to orthogonality.

In words: Given random variables $X \in \mathbb{R}^p$, $Y \in \mathbb{R}^q$ find linear combinations $u^T X$, $v^T Y$ with maximal correlation, successively, subject to orthogonality. 'Function' from law of pair (X, Y) to an optimal pair of bases.

Population CCA

In words: Given random variables $X \in \mathbb{R}^p$, $Y \in \mathbb{R}^q$ find linear combinations $u^T X$, $v^T Y$ with maximal correlation, successively, subject to orthogonality. 'Function' from law of pair (X, Y) to an optimal pair of bases.

Note: correlation is invariant to scaling, so normalise to have variance one.

Population CCA

In words: Given random variables $X \in \mathbb{R}^p$, $Y \in \mathbb{R}^q$ find linear combinations $u^T X$, $v^T Y$ with maximal correlation, successively, subject to orthogonality. 'Function' from law of pair (X, Y) to an optimal pair of bases.

Note: correlation is invariant to scaling, so normalise to have variance one. **In maths:** Inductively define u_k , v_k by

$$\begin{array}{l} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize }} \operatorname{Cov}\left(u^{T}X, v^{T}Y\right) \\ \text{subject to } \operatorname{Var}\left(u^{T}X\right) = \operatorname{Var}\left(v^{T}Y\right) = 1, \\ \operatorname{Cov}\left(u^{T}X, u_{j}^{T}X\right) = \operatorname{Cov}\left(v^{T}Y, v_{j}^{T}Y\right) = 0 \quad \text{ for } j = 1, \dots, k-1. \end{array}$$

In words: Given random variables $X \in \mathbb{R}^p$, $Y \in \mathbb{R}^q$ find linear combinations $u^T X$, $v^T Y$ with maximal correlation, successively, subject to orthogonality. 'Function' from law of pair (X, Y) to an optimal pair of bases.

Note: correlation is invariant to scaling, so normalise to have variance one. **In maths:** Inductively define u_k , v_k by

$$\begin{array}{l} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize }} \operatorname{Cov} \left(u^{T}X, v^{T}Y \right) \\ \text{subject to } \operatorname{Var} \left(u^{T}X \right) = \operatorname{Var} \left(v^{T}Y \right) = 1, \\ \operatorname{Cov} \left(u^{T}X, u_{j}^{T}X \right) = \operatorname{Cov} \left(v^{T}Y, v_{j}^{T}Y \right) = 0 \quad \text{ for } j = 1, \dots, k-1. \end{array}$$

Notation:

- ρ_k the optimal value called k^{th} canonical correlation
- $u_k^T X, v_k^T Y$ called canonical variates
- u_k, v_k called weights

$$\begin{split} & \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize Cov}\left(u^{T}X, v^{T}Y\right)} \\ & \text{subject to Var}\left(u^{T}X\right) = \text{Var}\left(v^{T}Y\right) = 1, \\ & \text{Cov}\left(u^{T}X, u_{j}^{T}X\right) = \text{Cov}\left(v^{T}Y, v_{j}^{T}Y\right) = 0 \quad \text{ for } j = 1, \dots, k-1. \end{split}$$

Weights are not the only interesting vectors - let's inspect matrix form - but skim links to rest of matrix analysis for now...

Image: A math the second se

$$\begin{split} & \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize Cov}\left(u^{T}X, v^{T}Y\right)} \\ & \text{subject to Var}\left(u^{T}X\right) = \text{Var}\left(v^{T}Y\right) = 1, \\ & \text{Cov}\left(u^{T}X, u_{j}^{T}X\right) = \text{Cov}\left(v^{T}Y, v_{j}^{T}Y\right) = 0 \quad \text{ for } j = 1, \dots, k-1. \end{split}$$

Weights are not the only interesting vectors - let's inspect matrix form - but skim links to rest of matrix analysis for now...

$$\begin{split} \max_{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}} \max_{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}} u^{T} \Sigma_{xy} v \\ \text{subject to } u^{T} \Sigma_{xx} u = 1, \ v^{T} \Sigma_{yy} v = 1, \\ u^{T} \Sigma_{xx} u_{j} = v^{T} \Sigma_{yy} v_{j} = 0 \text{ for } 1 \leq j \leq k - 1. \end{split}$$

æ

$$\begin{split} & \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize Cov}\left(u^{T}X, v^{T}Y\right)} \\ & \text{subject to Var}\left(u^{T}X\right) = \text{Var}\left(v^{T}Y\right) = 1, \\ & \text{Cov}\left(u^{T}X, u_{j}^{T}X\right) = \text{Cov}\left(v^{T}Y, v_{j}^{T}Y\right) = 0 \quad \text{ for } j = 1, \dots, k-1. \end{split}$$

Weights are not the only interesting vectors - let's inspect matrix form - but skim links to rest of matrix analysis for now...

$$\begin{split} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize}} & u^{T} \Sigma_{xy} v \\ \text{subject to } & u^{T} \Sigma_{xx} u = 1, \ v^{T} \Sigma_{yy} v = 1, \\ & u^{T} \Sigma_{xx} u_{j} = v^{T} \Sigma_{yy} v_{j} = 0 \text{ for } 1 \leq j \leq k - 1. \end{split}$$

Notation: Define canonical loadings

$$\Sigma_{xx}u_k = \operatorname{Cov}(X, u_k^T X), \quad \Sigma_{yy}v_k = \operatorname{Cov}(Y, v_k^T Y)$$

Reconstruction

Orthonormality constraints $u_k^T \Sigma_{xx} u_j = v_k^T \Sigma_{yy} v_j = \delta_{jk}$ for $1 \le j \le k - 1$.

So $(u_k), (\Sigma_{xx}u_k)$ and $(v_k), (\Sigma_{yy}v_k)$ are each pairs of *dual bases*.

э

イロト イヨト イヨト イ

Reconstruction

Orthonormality constraints $u_k^T \Sigma_{xx} u_j = v_k^T \Sigma_{yy} v_j = \delta_{jk}$ for $1 \le j \le k - 1$.

So $(u_k), (\Sigma_{xx}u_k)$ and $(v_k), (\Sigma_{yy}v_k)$ are each pairs of *dual bases*.

Hence

$$X = \sum_{k=1}^{p} \Sigma_{xx} u_k \langle u_k, X \rangle, \qquad Y = \sum_{k=1}^{q} \Sigma_{yy} v_k \langle v_k, Y \rangle$$

æ

イロト イヨト イヨト イ

Reconstruction

Orthonormality constraints
$$u_k^T \Sigma_{xx} u_j = v_k^T \Sigma_{yy} v_j = \delta_{jk}$$
 for $1 \le j \le k-1$.

So $(u_k), (\Sigma_{xx}u_k)$ and $(v_k), (\Sigma_{yy}v_k)$ are each pairs of *dual bases*.

Hence

$$X = \sum_{k=1}^{p} \Sigma_{xx} u_k \langle u_k, X \rangle, \qquad Y = \sum_{k=1}^{q} \Sigma_{yy} v_k \langle v_k, Y \rangle$$

Probabilistic CCA: Consider the model

$$egin{aligned} & Z \sim \mathcal{N}(0, I_d), & \min(p, q) \geq d \geq 1 \ & X | Z \sim \mathcal{N}(W_1 Z + \mu_1, \Psi_1), & W_1 \in \mathbb{R}^{p imes d}, \Psi_1 \succcurlyeq 0 \ & Y | Z \sim \mathcal{N}(W_2 Z + \mu_2, \Psi_2), & W_2 \in \mathbb{R}^{p imes d}, \Psi_2 \succcurlyeq 0 \end{aligned}$$

Then MLEs for W_1 , W_2 are essentially matrices of canonical loadings

Lennie Wells

イロト 不得 トイヨト イヨト

6/19

- High-level: two sets of data and want to understand interactions
- Different perspectives:
 - stats: estimation
 - bio-informatics: algorithm for data matrices, part of pipeline...
- Uses: Dimension reduction, visualisation / interpretation, multi-view / self-supervised learning
- Motivating Example: Multi-OMICS for human microbiome measuring p = 200 metabolites, and q = 800 enzymes for n = 500 individuals.

			۰.	•

• • • • • • • • • • •

• Main perspective: Exploratory Data Analysis (EDA) with an eye on physical interpretation. Loosely frequentist approach.

• Regularised CCA algorithms:

- ridge CCA: l2 penalty
- sparse CCA: l1 penalty

• Practical considerations:

- model / tuning parameter selection
- number of pairs to consider
- interpretation
- **Unanswered question:** Are these regularised CCA methods appropriate for real data? Might other structural assumptions be more natural.

- **New algorithm:** using **graphical lasso**; motivated by graphical models and conditional independence.
- **Practical advice:** for model comparison and interpretation motivated by the fundamental geometry of population CCA.

イロト イボト イヨト イヨ

- **New algorithm:** using **graphical lasso**; motivated by graphical models and conditional independence.
- **Practical advice:** for model comparison and interpretation motivated by the fundamental geometry of population CCA.

Main conclusions:

- CCA is fundamentally a subspace problem
- Variates and loadings are easier to estimate than weights
- Powerful visualisation via biplots
- Model selection is subtle
- Graphical lasso approach works well!

10/19

< □ > < 同 > < 回 > < Ξ > < Ξ

- **New algorithm:** using **graphical lasso**; motivated by graphical models and conditional independence.
- **Practical advice:** for model comparison and interpretation motivated by the fundamental geometry of population CCA.

• Main conclusions:

- CCA is fundamentally a subspace problem
- Variates and loadings are easier to estimate than weights
- Powerful visualisation via biplots
- Model selection is subtle
- Graphical lasso approach works well!

These may seem natural, but are far from the accepted wisdom, and should be a welcome contribution to the field.

Links with matrix analysis

$$\begin{split} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize}} & u^{T} \Sigma_{xy} v \\ \text{subject to } & u^{T} \Sigma_{xx} u = 1, \ v^{T} \Sigma_{yy} v = 1, \\ & u^{T} \Sigma_{xx} u_{j} = v^{T} \Sigma_{yy} v_{j} = 0 \text{ for } 1 \leq j \leq k - 1. \end{split}$$

• Singular Value Decomposition $(\rho_k, \Sigma_x^{1/2} u_k, \Sigma_y^{1/2} v_k)$ give SVD of $M := \Sigma_{xx}^{-1/2} \Sigma_{xy} \Sigma_{yy}^{-1/2}$

Links with matrix analysis

 $u \in \mathbb{R}$

$$\begin{split} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize}} & u^{T} \Sigma_{xy} v \\ \text{subject to } & u^{T} \Sigma_{xx} u = 1, \ v^{T} \Sigma_{yy} v = 1, \\ & u^{T} \Sigma_{xx} u_{j} = v^{T} \Sigma_{yy} v_{j} = 0 \text{ for } 1 \leq j \leq k - 1. \end{split}$$

- Singular Value Decomposition $(\rho_k, \Sigma_x^{1/2} u_k, \Sigma_v^{1/2} v_k)$ give SVD of $M := \Sigma_{xx}^{-1/2} \Sigma_{xy} \Sigma_{yy}^{-1/2}$
- Generalised Eigenvalue Problem: $Aw = \lambda Bw$

$$A = \begin{pmatrix} 0 & \Sigma_{XY} \\ \Sigma_{YX} & 0 \end{pmatrix}, \quad B = \begin{pmatrix} \Sigma_{XX} & 0 \\ 0 & \Sigma_{YY} \end{pmatrix}, \quad w = \begin{pmatrix} u \\ v \end{pmatrix}, \quad d = p + q.$$

< □ > < 同 > < 回 > < Ξ > < Ξ

Links with matrix analysis

 $\mu \in \mathbb{F}$

$$\begin{split} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\text{maximize}} & u^{T} \Sigma_{xy} v \\ \text{subject to } & u^{T} \Sigma_{xx} u = 1, \ v^{T} \Sigma_{yy} v = 1, \\ & u^{T} \Sigma_{xx} u_{j} = v^{T} \Sigma_{yy} v_{j} = 0 \text{ for } 1 \leq j \leq k - 1. \end{split}$$

- Singular Value Decomposition $(\rho_k, \Sigma_x^{1/2} u_k, \Sigma_y^{1/2} v_k)$ give SVD of $M := \Sigma_{xx}^{-1/2} \Sigma_{xy} \Sigma_{yy}^{-1/2}$
- Generalised Eigenvalue Problem: $Aw = \lambda Bw$

$$A = \begin{pmatrix} 0 & \Sigma_{XY} \\ \Sigma_{YX} & 0 \end{pmatrix}, \quad B = \begin{pmatrix} \Sigma_{XX} & 0 \\ 0 & \Sigma_{YY} \end{pmatrix}, \quad w = \begin{pmatrix} u \\ v \end{pmatrix}, \quad d = p + q.$$

Canonical Angles

 $\mathcal{X} := \text{span}(\{X_i : i = 1, ..., p\}), \mathcal{Y} := \text{span}(\{Y_i : j = 1, ..., q\})$ then CCA is $\max_{W_k \in \mathcal{X}, Z_k \in \mathcal{Y}} \langle W_k, Z_k \rangle$ subject to $\|W_k\|_2 < 1$, $\|Z_k\|_2 < 1$, $\langle W_k, W_i \rangle = \langle Z_k, Z_i \rangle = 0$ for $1 \le j \le k - 1$.

э

Probabilistic CCA

Consider the model:

$$egin{aligned} & Z \sim \mathcal{N}(0, I_d), & \min(p, q) \geq d \geq 1 \ & X | Z \sim \mathcal{N}(W_1 Z + \mu_1, \Psi_1), & W_1 \in \mathbb{R}^{p imes d}, \Psi_1 \succcurlyeq 0 \ & Y | Z \sim \mathcal{N}(W_2 Z + \mu_2, \Psi_2), & W_2 \in \mathbb{R}^{p imes d}, \Psi_2 \succcurlyeq 0 \end{aligned}$$

Then the MLEs of the parameters $W_1, W_2, \Psi_1, \Psi_2, \mu_1, \mu_2$ are

$$\begin{split} \hat{W}_1 &= \hat{\Sigma}_{xx} U_d M_1 \\ \hat{W}_2 &= \hat{\Sigma}_{yy} V_d M_2 \\ \hat{\Psi}_1 &= \hat{\Sigma}_{xx} - \hat{W}_1 \hat{W}_1^T \\ \hat{\Psi}_2 &= \hat{\Sigma}_{yy} - \hat{W}_2 \hat{W}_2^T \end{split}$$

and $\hat{\mu_1} = \bar{X}$, $\hat{\mu_2} = \bar{Y}$ where $M_1, M_2 \in \mathbb{R}^{d \times d}$ are arbitrary matrices with $M_1 M_2^T = R$, $\|M_1\| \le 1$, $\|M_2\| \le 1$

Graphical Models

- Setup: $X = (X^1, \dots, X^p)$ a random vector; G = (V, E) graph with $V = \{1, \dots, p\}$
- Key idea: graph structure constrains distribution of X
- Gaussian graphical models: $X^i \perp X^j | (X^k)_{k \neq i,j}$ whenever $(i,j) \notin E$

Image: A math a math

- Aim: Solve structure estimation problem
- Setup: samples x_1, \ldots, x_n from some zero-mean Gaussian with precision matrix $\in \mathbb{R}^{p \times p}$

• Write:
$$\mathbf{S} = \frac{1}{n} \sum_{i=1}^{n} x_i x_i^T \in \mathbb{R}^{p \times p}$$

• Log-likelihood:

$$I(\Omega; \mathbf{X}) = \log \det - \operatorname{trace}(\mathbf{S})$$

• Penalised Objective:

$$\hat{} \in \operatorname{argmax}_{\succeq 0} \{ \log \det - \operatorname{trace}(\mathbf{S}) - \alpha \rho_1() \}$$

where: $\alpha \in (0,\infty)$ is a penalty parameter, $\rho_1() = \sum_{i \neq j} |\Omega_{ij}|$

æ

イロト 不得 トイヨト イヨト

Observations:

- $\Sigma = \Omega^{-1}$ is differentiable function of Ω .
- M is a differentiable function of Σ
- So $M = f(\Omega)$ where f is differentiable

Algorithm: Estimate Ω with graphical lasso, plug-in $\hat{M} = f(\hat{\Omega})$, then apply SVD

Observations:

- $\Sigma = \Omega^{-1}$ is differentiable function of Ω .
- M is a differentiable function of Σ
- So $M = f(\Omega)$ where f is differentiable

Algorithm: Estimate Ω with graphical lasso, plug-in $\hat{M} = f(\hat{\Omega})$, then apply SVD

Theorem: can combine results in the literature to see convergence rate

$$\sin \Theta(\hat{B}, B) \lesssim s_0(p) \left(\frac{\log p}{n}\right)^{1/2}$$

Existing Methods: PMD [WTH09]

Penalised Matrix Decomposition A natural but difficult objective:

$$\begin{array}{l} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\operatorname{maximize}} \frac{1}{n} u^{T} \mathbf{X}^{T} \mathbf{Y} v \\ \text{subject to } \frac{1}{n} \| \mathbf{X} u \|_{2}^{2} \leqslant 1, \quad \frac{1}{n} \| \mathbf{Y} v \|_{2}^{2} \leqslant 1, \quad \| u \|_{1} \leqslant c_{1}, \quad \| v \|_{1} \leqslant c_{2} \end{array}$$

Make constraints tractable:

$$\begin{array}{l} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\operatorname{maximize}} \frac{1}{n} u^{T} \mathbf{X}^{T} \mathbf{Y} v \\ \text{subject to } \|u\|_{2}^{2} \leqslant 1, \ \|v\|_{2}^{2} \leqslant 1, \ \|u\|_{1} \leqslant c_{1}, \ \|v\|_{1} \leqslant c_{2}. \end{array}$$

Justification: Identity approximation valid

Algorithm: alternate between solving for u, v by soft-thresholding

イロト イポト イヨト イヨト

Existing Methods: PMD [WTH09]

Penalised Matrix Decomposition A natural but difficult objective:

$$\begin{array}{l} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\operatorname{maximize}} \frac{1}{n} u^{T} \mathbf{X}^{T} \mathbf{Y} v \\ \text{subject to } \frac{1}{n} \| \mathbf{X} u \|_{2}^{2} \leqslant 1, \quad \frac{1}{n} \| \mathbf{Y} v \|_{2}^{2} \leqslant 1, \quad \| u \|_{1} \leqslant c_{1}, \quad \| v \|_{1} \leqslant c_{2} \end{array}$$

Make constraints tractable:

$$\begin{array}{l} \underset{u \in \mathbb{R}^{p}, v \in \mathbb{R}^{q}}{\operatorname{maximize}} \frac{1}{n} u^{T} \mathbf{X}^{T} \mathbf{Y} v \\ \text{subject to } \|u\|_{2}^{2} \leqslant 1, \ \|v\|_{2}^{2} \leqslant 1, \ \|u\|_{1} \leqslant c_{1}, \ \|v\|_{1} \leqslant c_{2}. \end{array}$$

Justification: Identity approximation valid

Algorithm: alternate between solving for u, v by soft-thresholding

Later pairs: Apply with $\frac{1}{n} \mathbf{X}^T \mathbf{Y} - \sum_{j=1}^{k-1} d_j u_j v_j^T$

イロト 不得 トイヨト イヨト

Existing Methods: AMA [SMN⁺17]

Alternating Minimisation Algorithm

Use Lagrange multiplier penalty rather than explicit constraints:

$$\begin{split} \underset{u,v}{\text{minimize}} & -\frac{1}{n} u^T \mathbf{X}^T \mathbf{Y} v + \tau_1 \| u \|_1 + \tau_2 \| v \|_1 \\ & + \mathbb{1} \left\{ u : \frac{1}{n} \| \mathbf{X} u \|_2^2 \le 1 \right\} + \mathbb{1} \left\{ v : \frac{1}{n} \| \mathbf{Y} v \|_2^2 \le 1 \right\} \end{split}$$

Algorithm: alternate between solving for u, v. For v fixed get:

$$\underset{u \in \mathbb{R}^{p}, z \in \mathbb{R}^{n}}{\underset{f(u)}{\underset{f(u)}{\underset{f(u)}{\underset{f(u)}{\underset{f(u)}{\underset{f(u)}{\underset{f(u)}{\underset{f(u)}{\underset{g(z)$$

Tool: Linearized ADMM

Existing Methods: AMA [SMN⁺17]

Alternating Minimisation Algorithm

Use Lagrange multiplier penalty rather than explicit constraints:

$$\begin{split} \underset{u,v}{\text{minimize}} & -\frac{1}{n} u^T \mathbf{X}^T \mathbf{Y} v + \tau_1 \| u \|_1 + \tau_2 \| v \|_1 \\ & + \mathbb{1} \left\{ u : \frac{1}{n} \| \mathbf{X} u \|_2^2 \le 1 \right\} + \mathbb{1} \left\{ v : \frac{1}{n} \| \mathbf{Y} v \|_2^2 \le 1 \right\} \end{split}$$

Algorithm: alternate between solving for u, v. For v fixed get:

$$\underset{u \in \mathbb{R}^{p}, z \in \mathbb{R}^{n}}{\text{minimize}} \underbrace{-u^{T} \mathbf{X}^{T} \mathbf{Y} v + \tau_{1} \| u \|_{1}}_{f(u)} + \underbrace{\mathbb{1} \left\{ \| z \|_{2} \leq 1 \right\}}_{g(z)}$$

subject to $\mathbf{X}u = z$

Tool: Linearized ADMM

Later pairs: Add constraint $U^T \mathbf{X}^T \mathbf{X} u = 0$; $V^T \mathbf{Y}^T \mathbf{Y} v = 0$
